Queue Volume Shift Brief (v1.6)

Operator decision brief for weekly queue volume shifts.

Data through: 2026-02-05
Generated: 2026-02-05 21:38:19

Executive Snapshot

Decision: HOLD queue expansion; validate persistence before actioning capacity.

Impact (vs 8w baseline): Baseline **7,740/wk** → Current **30,831/wk**
Δ **+23,091/wk** (≈ **+4,618/business day**)

Comparator validity: CONFIRMED **Actionability status:** LIMITED_CONTEXT **Partial-week risk:** MED (5,612/30,831 = 18.2%)

Why LIMITED_CONTEXT (reversible actions only):

- Volume shift trigger tripped (|%Δ| ≥ 15% vs rolling 8-week median baseline).
- Partial-week activity present (18.2% of anchor week) + history tier 12w (LIMITED_CONTEXT).

Next actions (reversible):

- Validate day-of-week pattern vs baseline band (rule out cutoff/lag effects).
- Segment the delta (payer/LOB/driver) and triage top contributors.
- Re-check after the next complete+mature week closes; defer capacity/staffing changes until persistence is confirmed.

Executive Translation (plain English)

- **Baseline** = the typical weekly volume (rolling 8-week median).
- **Current** = the latest complete + mature week we trust for decisions.
- **Partial-week activity** = the current in-progress week (can be misleading).
- **Comparator validity** = we have a complete week to compare against baseline (apples-to-apples).
- **Actionability status (LIMITED_CONTEXT)** = we treat the signal as real enough to investigate, not real enough for irreversible changes.
- **Capacity index** = current ÷ baseline (how many times larger than normal).

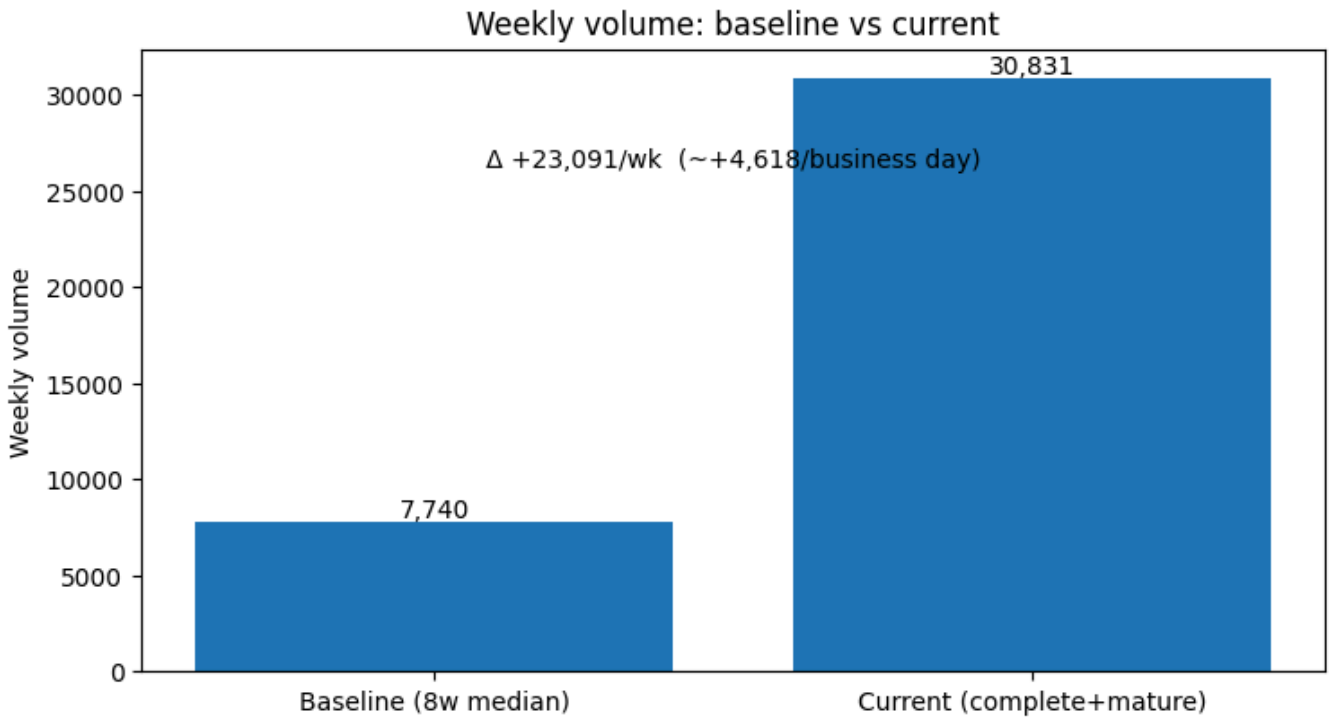
Micro glossary (6 terms)

- **Complete week:** 7/7 days present for the anchor week.
- **Mature gate:** in real ops, use settled/adjudicated window (e.g., 45+ days) before trusting volume.
- **Rolling 8-week median:** robust baseline resistant to one-off spikes.
- **Partial-week ratio:** partial-week volume ÷ anchor week volume.
- **Actionability status:** STABLE / INVESTIGATE / LIMITED_CONTEXT (drives reversible vs irreversible actions).
- **Other (mix shift):** remainder outside Top-N segments, aggregated so totals reconcile.

Data contract (required fields)

	Field	Alt name	Required?	Type	Used for
0	week_start	—	Yes	date	weekly rollups + baselines
1	date	—	Yes	date	day-of-week ramp
2	dow	day_of_week	Yes	int (0-6)	DOW comparisons + bands
3	segment	payer / lob / driver	Yes	string	segment deltas + mix shift
4	volume	count	Yes	int	all volume KPIs
5	invalid_volume	—	No	int	data quality watchlist (materiality gating)
6	invalid	invalid_flag	No	0/1	invalid reason drilldown (optional)

Impact translation (baseline vs current)



> **Interpretation:** Use this slide to size the magnitude. Percent change is secondary; the actionable number is Δ/day.

Capacity index ≈ **3.98×** (current ÷ baseline).

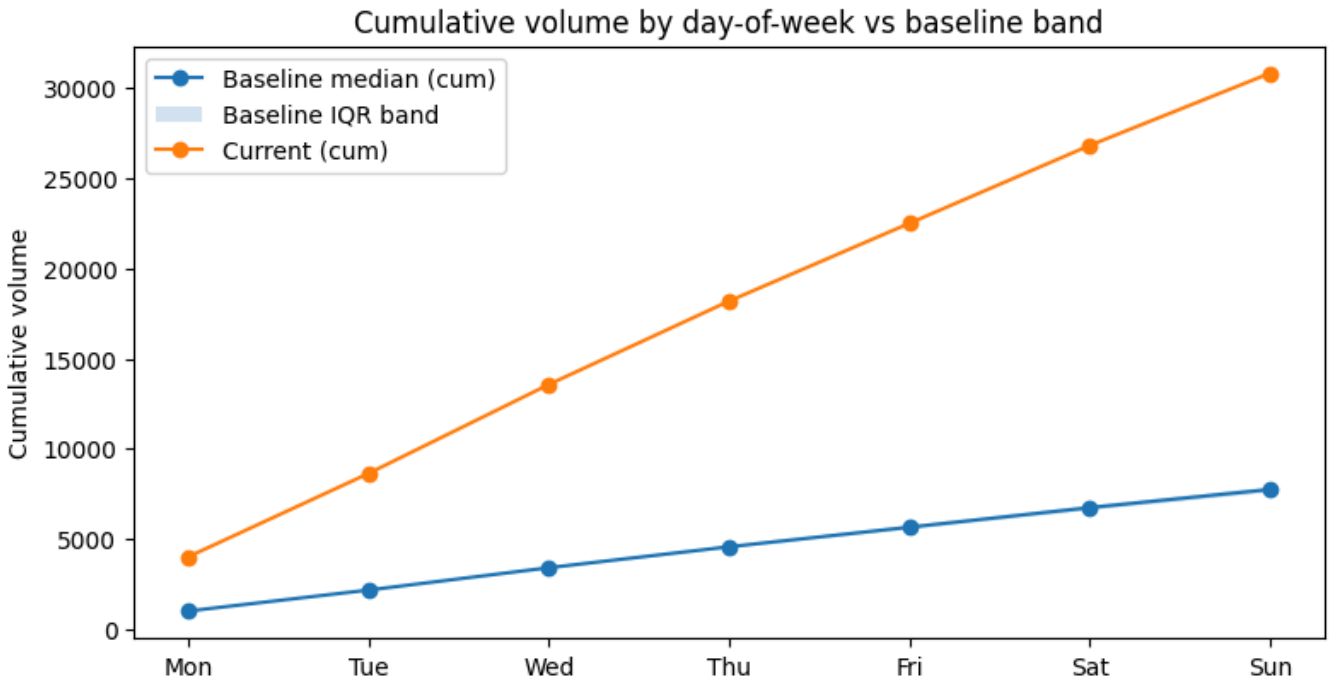
	Assumed throughput/day	Net backlog change/day
0	500	+4,118
1	1000	+3,618
2	2500	+2,118
3	5000	-382

Illustrative sizing input (not a staffing recommendation).

Validity Receipt

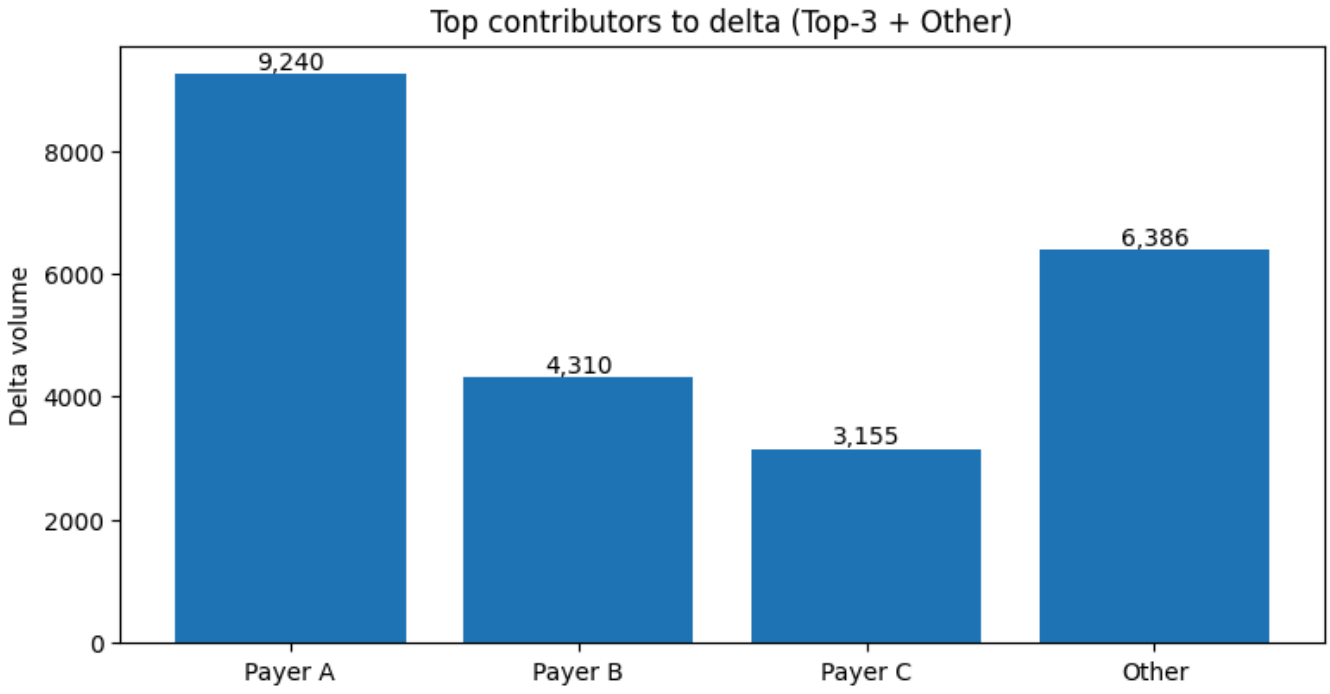
Data through: 2026-02-05 | Anchor week: 2026-01-26 | Comparator: CONFIRMED | Actionability: LIMITED_CONTEXT | Partial-week risk: MED (5,612/30,831 = 18.2%) | History tier: 12w (LIMITED_CONTEXT)

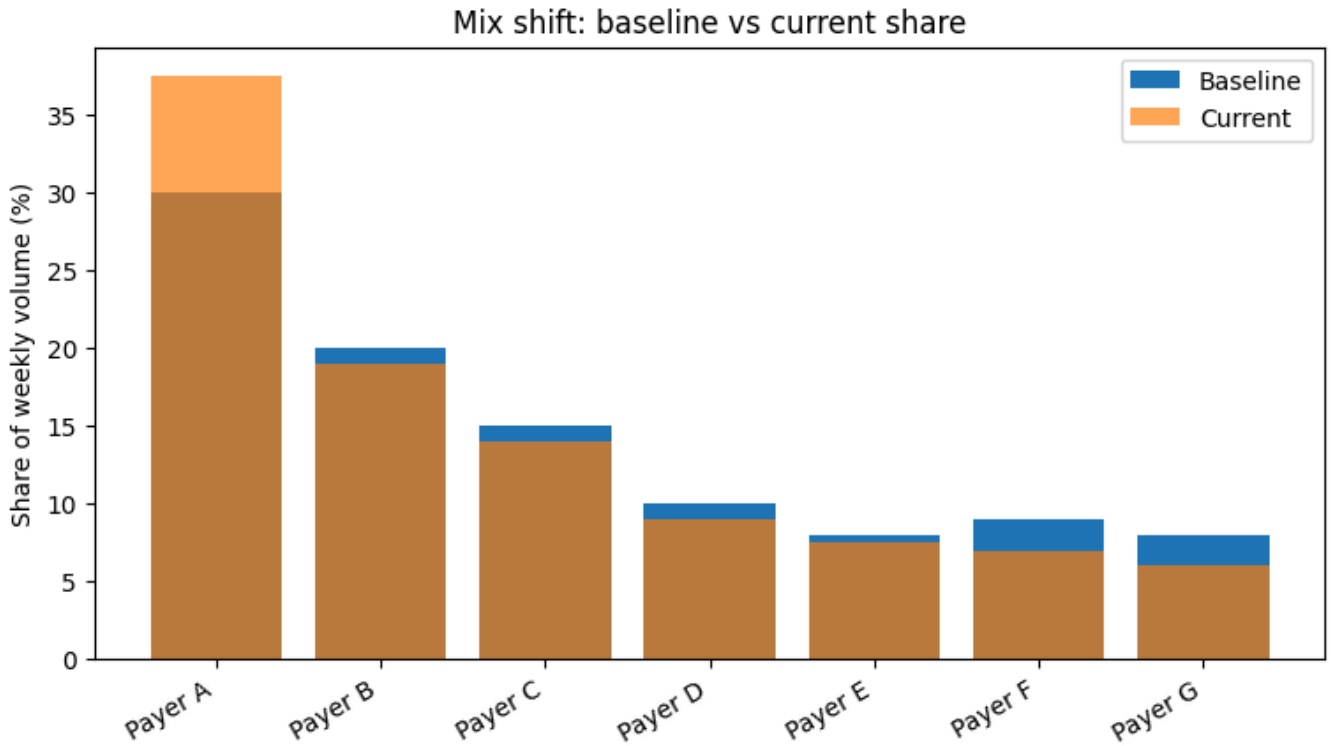
Week completeness ramp



> **Interpretation:** Largest positive divergence days: Wed, Tue. Confirm if pattern persists in next complete week.

Segment drivers + mix shift





Other = all remaining segments outside Top-N (ranked by |delta|), aggregated. (N=4) Top contributors inside Other: Payer D, Payer E.

Drivers shown: 3 (of 7). Other = remaining segments (N=4). Top contributors inside Other: Payer D, Payer E.

> **Interpretation:** Use this slide to answer: 'Where is the delta coming from?' and 'Did composition change?'

Decision + trigger rules

- **Decision:** HOLD queue expansion; validate persistence before actioning capacity.
- **Volume shift trigger:** |%Δ| ≥ 15% vs rolling 8-week median baseline (observed: 298.3%).
- **Comparator validity gate:** only compare complete+mature weeks (current is CONFIRMED).
- **When LIMITED_CONTEXT:** take reversible actions (validate/segment/triage) and defer capacity/staffing/process changes until persistence is confirmed.

Decision Criteria (HOLD -> EXPAND)

- **Flip HOLD -> EXPAND only if ALL are true:**
  1. Next complete+mature week remains ≥ +15% vs baseline (current: 298.3%).
  2. Sensitivity check agrees (6w vs 8w and median vs trimmed mean do not change direction).
  3. DOW divergence is not a single-day artifact (≥2 days outside baseline band).
  4. Same top contributors account for most of the delta (Top-3 share stays dominant).
- **If any condition fails:** keep HOLD and continue reversible actions only.

Appendix: Data Quality Watchlist

Invalid volume (anchor week): 0
Invalid rate: 0.00%

No alert: invalids are below materiality threshold; monitor only.

	segment	invalid_volume	volume	invalid_rate_%
0	Payer A	0	11560	0.0
1	Payer B	0	5859	0.0
2	Payer C	0	4317	0.0
3	Payer D	0	2774	0.0
4	Payer E	0	2314	0.0
